

RESEARCH PAPERS

Factory-to-Customer Shipping Route Efficiency Analysis

1. Data-Driven Order Consolidation with Vehicle Routing Optimization

This paper studies delivery route optimization using Vehicle Routing Problem (VRP) models to improve logistics efficiency and supplier profitability. It compares time-based and quantity-based delivery consolidation strategies.

2. Hybrid Optimization of Logistics Distribution Paths Using Neural Networks and Fuzzy Logic

This research proposes an intelligent logistics route optimization framework using neural networks and fuzzy logic for improving distribution efficiency in complex logistics environments.

3. Multi-Product Pickup and Delivery Supply Chain Design with Location-Routing and Direct Shipment

The paper focuses on optimizing supply chain distribution centers, pickup and delivery routing, and direct shipment systems to reduce transportation costs and improve operational efficiency.

4. Vehicle Routing Optimization Algorithms for Pharmaceutical Supply Chain

This study compares different routing optimization algorithms used in logistics and transportation systems to improve supply chain performance and reduce delivery inefficiencies.

5. Research on Optimization of International Multimodal Transportation Routes Based on Uncertainty Theory

The paper presents transportation route optimization under uncertain logistics conditions using adaptive optimization algorithms to improve reliability and cost efficiency.

6. Delivering and Picking Goods Under Time Window Restrictions

This paper studies routing and scheduling optimization under time-window constraints to minimize transportation costs and improve delivery performance.

7. Two-Stage Optimization Scheme of Routing Scheduling from a Single Distribution Center to Multiple Customers

This research focuses on last-mile logistics optimization and customer delivery scheduling to improve transportation efficiency and service quality.

8. The New Generation of Operations Research Methods in Supply Chain Optimization

This review paper discusses modern optimization approaches in supply chain management, including transportation routing, facility location, and logistics planning techniques
